An implementation in C++ of a Topological Sorting algorithm in a directed acyclic graph
Octavian Nicolio, University of Indianapolis

A topological sort on a directed acyclic graph is a linear ordering of all its vertices. Many solutions of the Topological Sorting problem appeared in literature over the years, using different algorithms and implemented in different programming languages. Our C++ program uses hash tables, linked-lists and object-oriented features. The implementation has the advantage of being memory efficient.

Keywords: topological sorting algorithms, directed acyclic graph, C++ programming language
